                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention provides a mutant antibody comprising a reactive site that is not present in the wild-type of the antibody. The antibody also has a complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The cactive site of the mutant antibody is in a position proximate to or within the CDR, such that the chelate and the antibody are able to form a covalent bond. The present sequence is that of the light chain variable covalent bond. The present sequence is that of the light chain variable region of anti-indium-EDTA monoclonal antibody CHA255, carrying a S95C mutation. As an example of the method of the invention, rational computer added design was used to develop an indium-EDTA chelate to covalently bind to CHA255 bund to a tumour and then to covalently attach the covalently to CHA255 bund to a tumour and then to covalently attach the chelate to the antibody, thereby trapping it at the tumour site. This involved cloning the variable domains of CHA255 to construct a human/mouse chimeric Fab fragment that could be expressed in Escherichia coli, and the synthesis and screening of benzyl-EDTA chelates carrying viac, in this Fab can be conjugated to a targeting moiety when desired. A reactive site was incorporated into the antibody by engineering a Cys residue at location Asn-96 or Ser-95 of the light chain, near the region of the antibody to which the chelate bound. This was accomplished by site catered antibody to which the chelate bound. This was accomplished by site anti-chelate antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            VPARFSGSLIGDKAALTITGAQTEDEARYFCALWYCNLWVFGGGTKLTVLSRTVAAPSVF 120

metal chelate against which the wild-type antibody is raised. The metal chelate against which the wild-type antibody is raised. The cactive site of the mutant antibody is in a position proximate to or within the CDR, such that the chelate and the antibody are able to form covalent bond. The present sequence is that of the light chain of antibody chelate indium-EDTA monoclonal antibody CHA255. As an example of the method of the invention, rational computer-aided design was used to develop an indium-EDTA chelate to covalently bind to CHA255 in vivo. The premise was indium-EDTA chelate to bind non-covalently to CHA255 bound to a tumour and then to covalently attach the chelate to the antibody, thereby trapping it at the tumour site. This involved cloning the variable domains of CHA255 to construct a human/mouse chimeric Fab fragment that could be expressed in Escherichia coli, and the synthesis and screening of benzyl-EDTA chelates carrying weakly electrophilic groups capable of conjugation of the antibody in vivo. This Fab can be conjugated to a cargeting moiety when desired. A reactive site was incorporated into the antibody by engineering a conjugate at location Asn-96 or Ser-95 of the light chain, near the region of the antibody to which the chelate bound. This was accomplished by site chiracted mitospering of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          VPARFSGSLIGDKAALTITGAQTEDEARYFCALMYCNLWVFGGGTKLTVLSRTVAAPSVF 120

/note= "complementarity determining region 2"

```
The invention provides a mutant antibody comprising a reactive site that is not present in the wild-type of the antibody. The antibody also has a complementarity determining region (CDR) that specifically binds to a metal chelate against which the wild-type antibody is raised. The complementarity determining region (CDR) that selection proximate to or within the CDR, such that the chelate and the antibody are able to form a covalent bond. The present sequence is that of the light chain variable contained bond. The present sequence is that of the light chain variable corregion of anti-indium-EDTA monoclonal antibody CHA255, carrying an N96C region of anti-indium-EDTA monoclonal antibody CHA255, carrying an N96C caided design was used to develop an indium-EDTA chelate to covalently consolently to CHA255 bound to a tumour and then to covalently attach the covalently to CHA255 bound to a tumour and then to covalently attach the covalently to CHA255 bound to a tumour and then to covalently attach the covalently and the spitheds and screening of CHA255 to construct a involved cloning the variable domains of CHA255 to construct a consoler to the antibody, thereby trapping it at the tumour site. This coli, and the spitheds and screening of CHA255 to construct a coli, and the spitheds and screening of Denzyl-EDTA chelates carrying coli, and the spitheds and screening of conjugation of the antibody in vivo. This Fab can be conjugated to a targeting moiety when desired. A vivo. This Fab can be conjugated into the antibody by singineering a Cys creative site was incorporated into the antibody by engineering a Cys creative site was incorporated into the hight chain, near the region of the antibody to which the chelate bound. This was accomplished by site consisted mutagenesis of a nucleic acid encoding the wild-type of the conjugated or ser-eps of the ser-eps or the region of the antibody to which the chelate bound and the coding the wild-type of the coding the series of the ser-eps of the ser-eps of the ser-eps of the ser-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid encoding a mutant antibody comprising a reactive site that specifically binds to a metal chelate useful as analytical agents and in clinical diagnosis, as well as in the treatment of disease, particularly

Specifically, it refers to an antibody that comprises a metal chalate bound to an antigen recognition domain, where the metal chelate has a reactive functional group of complementary reactivity to the reactive site of the antibody. This reactive site is the side chain of a naturally occurring amino acid e.g. the -SH group side chain of a cysteine residue (not present in the wild type) which can be used to form a covalent bond between the reactive site of the antibody and the

reactive functional group of the metal chelate. The present invention describes using these antibodies for in vivo imaging where the antibody comprises a targeting moiety that binds specifically to a cell via a cell surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex. Is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide sequence is the chimeric mutine antibody 2012.5 variable light chain protein fused to the human anti-tetanus toxin antibody kappa light chain constant region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

chelating agents to multi-inncitonal anitoboates that recognized chelates. Specifically, it refers to an antibody that comprises a metal chelates. Specifically, it refers to an antibody that comprises a metal chelate bound to an antigen recognition domain, where the metal chelate chelate bound to an antigen recognition domain, where the metal chelate caretive functional group of complementary reactivity to the reactive functional group of complementary reactivity to the reactive functional group of complementary reactivity to the coverent bond between the reactive site of the antibody and the caretive functional group of the metal chelate. The present invention of reactive functional group of the metal chelate. The present invention comprises using these antibodies for in vivo imaging where the antibody complex. Surface receptor or antigen thus forming a cell-mutant antibody complex. On addition of the metal chelate, a cell-antibody-metal chelate complex is formed that can be detected using emission tomography, magnetic resonance imaging, lanthanide luminescence, gamma-emissions or single photon emission tomography (SPET). As such, this method is useful for treating a subject with cancer and pharmaceutical compositions exhibit cytostatic and immunosuppressive activities. This polypeptide sequence is the chimeric mutant NSSC murine antibody 2D12.5 variable light chain
                                                                                                                                                                                                                                                                                              Novel mutant antibody comprising reactive site not present in wild-type of antibody and antigen recognition domain that recognizes macrocyclic metal chelate having four nitrogen atoms, useful for treating cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 RSAVVTQESALTTSPGETVTLTCRSSIGAVTTSNYANWVQEKPDHLFTGLIGGTNNRAPG

internalising human binding molecules are capable of (specifically tecognises human B cell associated antigen CD72. An SCPV ADR23324 selected from an antibody phage display library was shown to specifically recognise the human CD72 receptor. The scrv was recloned in IgG expression vector Col using primers designed to restore complete human frameworks, thereby generating antibody 025. Such anti-CD72 immunoglobulins or their antigen-binding fragments can be used as internalising human binding molecules are capable of (specifically) binding to CD72 or its antigenic determinant, and preferably bind to CD72 associated with cells. Upon binding to CD72 present on the surface of associated with cells. Upon binding pro CD72 present on the surface of internalising human binding molecules internalise. In addition to the internalising human binding molecules, the invention provides immunoconjugates comprising an internalising human binding molecule and a immunoconjugates comprising an internalising human binding molecule and a immunoconjugates. tag (toxic substance, radioactive substance, liposome and/or enzyme), nucleic acids encoding these, and compositions comprising them. The internalising human binding molecule, immunoconjugate, nucleic acid molecule or composition can be used in the diagnosis and/or treatment of a B cell associated disorder or disease, especially a B cell associated cancer and B cell associated autoimmune disorder (claimed).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to domain deleted CC49 or C2BB antibodies.

Domain deleted CC49 antibodies comprise a heavy chain human CC49 domain deleted sequence in which CL72 domain has been deleted and are reactive with tumour associated antigen (TAG3-72. The C2BB antibodies are reactive with tumour associated antigen (TAG3-72. The C2BB antibodies are reactive with CD20 and comprise a heavy chain having a sequence of a derived domain deleted C2BB construct where the CH2 domain has been deleted.

Sequences of the invention are useful for imaging a neoplasm. They are also useful for treating myelosuppressed patients suffering from neoplastic disorder such as haematologic neoplasm, preferably non-chain such as haematologic mopalsmy. They are neoplastic disorder, colon cancer and haematologic malignancy. They are useful for reducing tumour size, inhibiting tumour growth and/or prolonging the survival time of tumour-bearing animals and for treating tumours. The present sequence is human C2BB light chain protein. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ë,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel domain deleted CC49 antibody reactive with tumor associated antigen -72, or C2B8 antibody reactive with CD20, useful for treating myelosuppressed patient suffering from a neoplastic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               28

```
monomeric subunits, where the monomeric subunits are non-covalently associated. (I) is useful for treating a disorder, especially immune disorder, and neoplastic disorder such as relapsed Hodgkin's disease, resistant Hodgkin's disease high grade, low grade and intermediate grade non-Hodgkin's lymphomas, B cell chronic lymphocytic leukemia (B-CLL), lymphoma (FL), diffuse large cell lymphoma (DCLL), Burkitt's lymphoma, AIDS-related lymphomas, monocytic B cell lymphoma, angioimmunoblastic lymphomas, monocytic, follicular, diffuse small cleaved cell, large cell immunoblastic lymphoblastoma, small cleaved cell, arge cell immunoblastic lymphoblastoma, small cleaved burkitt's and non-Burkitt's, follicular, mixed small cleaved and large cell lymphoms, in a mammal (see ABZ24017 for a detailed description of the various uses of (I)). The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel dimeric antibody useful for treating immune disorder and neoplastic disorder, has several non-covalently associated monomeric subunits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C2B8; antibody; cytostatic; antiallergic; antianemic; antiasthmatic; vsotropic; immunomodulator; protozoacide; antidiabetic; nephrotropic; thyromimetic; hepatotropic; haemostatic; antileprotic; antibacterial; neuroprotective; antipsoriatic; antintheumatic; antiarthritic; antiulcer; dermatological; immunosuppressive; antiinflammatory.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is used in a method for obtaining a novel gene construct (A) which expresses, in cells of a mammal, a conjugate (B) of a cell-targeting group (I) and a heterologous prodrug-converting enzyme (II), and (B) is directed to leave the cell for selective localisation at a cell surface antigen (Ag) recognised by (I). Delivery of (A) to a target site, then administration of (III) is used for targeted release of cytotoxic drug, specifically for treating cancer but also inflammation such as rheumatoid arthritis. In situ generation of the targeting antibody increases selectivity, reducing side effects at normal tissue. The method is applicable to any antibody-directed enzyme prodrug therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New gene construct expressing conjugate of targetting agent and prodrug-
converting enzyme - useful for, e.g. targetted production of cytotoxic
drug in vivo, especially for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          4 VVTQESA-LITISPGETVTLICRSSIGAVITSNYANWVQEKPDHLFTGLIGGINNRAPGVP

                                                    The invention relates to an antibody comprising an Fc variant portion having an amino acid modification in the Fc region of the parent Fc polypeptide, where the Fc variant modulates binding to an Fc-gamma-R compared to the parent Fc polypeptide. The antibody may also be used in research and in agricultural or industrial applications. This sequence corresponds to the light chain of the antibody "Rituximab" as an example
                                                                                                                                                                                                                                                                                                                                                                                               cytostatic; antiinflammatory; cardiovascular; gene therapy; antibody; Fc; agriculture; industrial application.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4 VVTQESA-LTTSPGETVTLTCRSSIGAVTTSNYANWVQEKPDHLFTGLIGGTNNRAPGVP

The dimeric immunoglobulin is used in the method of the invention. The specification describes a method for producing an immunoglobulin (Ig) G/IgG dimer. The method comprises genetically engineering a monoclonal antibody to introduce a cysteine molecule which inhibits formation of intramolecular disulphide bridges between sister heavy. Chains on the same antibody molecule. The dimer is a homodimer or heterodimer that is capable of activating components of the complement system, and has the ability to activate and kill cells via the complement cascade. The dimer is also capable of binding to Fogamma receptors or initiating programmed cell death. The IgGIGG dimers may be used to treat allergic disorders, cancers and autoinmune diseases such as allergic asthma, allergic bronchopulmonary aspergillosis, allergic rhinitis,

allergic contact dermatitis, CLL cancers and/or B-cell lymphomas. They may also be used to treat a range of other diseases and disorders such as rheumatoid arthritis, ulcerative colitis, psoriasis, pigeon breeder's disease, hepatitis, leprosy, Lyme disease, diabetes mellitus, candidiasis and aplastic anaemia. They are also useful for inducing hyper-cross-linking of membrane antigens and for the preferential killing of selected cell populations. (Updated on 12-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     178

specific humanised antibody called BIWA8 and BIWA4. Sequences of the invention are useful for manufacturing a medicament and for treating cancer including colorectum, non-small cell lung, breast, head and neck ovarian, lung, bladder, pancreatic cancer or metastatic cancers of the brain. They are also useful in antibody therapy. The present sequence is BIWA48 antibody light chain mature protein. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                          117
                                                                                                                                                                                                                                                                                                                          182
                                                                                                                                                                                                                                                                                                                                                    177

                                                                                                                                                                                                                                                                                                                                    28
(CD44) with a cytotoxic compound is used optionally in combination with chemotherapeutic agent. The method of the invention has cytostatic applications and may be useful in the preparation of a pharmaceutical composition for the treatment of cancer, particularly head and neck squamous cell carcinoma, oesophagus squamous cell carcinoma, skin squamous cell carcinoma, lung adenocarcinoma, cervix squamous cell carcinoma, pancreas adenocarcinoma, colon adenocarcinoma, lung adenocarcinoma, pancreas adenocarcinoma, colon adenocarcinoma and stomach adenocarcinoma. The current sequence is that of the humanised murine antibody BIWAB light

The invention relates to a compound comprising CD44 specific antibody molecule conjugated to a highly cytotoxic drug, which cleaves under intracellular conditions. The compound is used in pharmaceutical composition for the treatment of cancer, solid tumours, and as an adjuvant to surgical intervention to treat minimal residual disease. The present sequence is humanised murine antibody BIWA4 light chain protein
                                                                                                                                                                                                                                                                                                                                                                                                                                          New compound useful for treatment of cancer comprises CD44 specific antibody molecule conjugated to a highly cytotoxic drug, which cleaves under intracellular conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠ
                                                                           The present invention describes using a compound (CD) of formula A(LB),
where A is an antibody molecule which is specific for CD44, L is a linker
molety, B is a compound which is toxic to cells, and n is a decimal
cumber between 1-10, for the preparation of a pharmaceutical composition
for the treatment of cancer, where CD is used or is for use in
combination with radiotherapy. Also described: (1) use of a conjugate
CC combination with radiotherapy. Also described: (1) use of a conjugate
CC combination with radiotherapy; (2) a
manufacture of a pharmaceutical composition for the treatment of cancer,
where CJ is used or is for use in combination with radiotherapy; (2) a
pharmaceutical composition. Con together with a
cradioimmunotherapeutic agent and optionally further comprising one or
more carrier(s), diluent(s), or excipient(s); (3) a kit comprising, in a
cardioimmunotherapeutic agent; and (4) use of radioimmunotherapeutic agent
cc radioimmunotherapeutic agent; and (4) use of radioimmunotherapeutic
CC reatment of cancer, where the radioimmunotherapeutic agent is used or is
CC for use in combination with CD or CJ. CD and CJ have cytostatic
cc crisein and can be used as immunostimulators. CJ is useful for the
manufacture of a medicament for the treatment of cancer e.g. head and
cneck squamous cell carcinoma, solon adenocarcinoma, pancreas
cc denocarcinoma, breast adenocarcinoma, lung adenocarcinoma, pancreas
cc denocarcinoma, colon adenocarcinoma, lung adenocarcinoma, pancreas
cc denocarcinoma, colon adenocarcinoma, lung adenocarcinoma, pancreas
cc denocarcinoma, colon adenocarcinoma, lung adenocarcinoma, colon adenocarcinoma, colon adenocarcinoma, colon adenocarcinoma, lung adenocarcinoma, colon adenocarcinoma, and stomante compensente a humanistering conterior anticherapeutic combination with r
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ě
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ARFSGSLIGDKAALTITGAQTEDEARYFCALWYCNLWVFGGGTKLTVLSRTVAAPSVFIF 122

Sequence 79, Application US/09315926A

Patent No. 6498027

GENERAL INFORMATION:

APPLICANT: Bavenga, Menzo

APPLICANT: Havenga, Menzo

APPLICANT: Havenga, Menzo

APPLICANT: Havenga, Menzo

APPLICANT: Verlinden, Stefan

TITLE OF INVENTION: TARGETED DELIVERY THROUGH A CATIONIC AMINO ACID TRANSPORTER

FILE REFERENCE: 2183-4080US

CURRENT APPLICATION NUMBER: EP 99201593.3

PRIOR APPLICATION NUMBER: EP 99201693.3

PRIOR FILING DATE: 1998-05-20

PRIOR FILING DATE: 1998-05-20

NUMBER OF SEQ ID NOS: 81

SOCTWARE: PATENT VERSION 3.0

SEQ ID NO 79

LENGTH: 236
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         71 GDKAALTITGAQTEDEARYFCALWYCNLWVFGGGTKLTVLSRTVAAPSVFIFPPSDEQLK 130

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4;
Sequence 14, Application US/09472087

Sequence 14, Application US/09472087

Patent No. 6682736

GENERAL INFORMATION:
APPLICANT: HANSON, DOUGLAS C.
APPLICANT: HANSON, MARK J.
APPLICANT: HANNE, EILLEN E.
APPLICANT: HANNE, STEVEN C.
APPLICANT: GEOFFREY H.
APPLICANT: GEOFFREY H.
APPLICANT: CORVALAN, JOSE R.
TITLE OF INVENTION: HUMAN MONOCLONAL ANTIBODIES TO CTLA-4
FILE REFERENCE: ABX-PP1
CURRENT APPLICATION NUMBER: US/09/472,087
CURRENT APPLICATION NUMBER: 60/113,647

PRIOR APPLICATION NUMBER: 60/113,647

PRIOR PILING DATE: 1999-12-23

PRIOR PILING DATE: 1998-12-23

NUMBER OF SEQ ID NOS: 147

SOFTWARE: Patentin Ver. 2.1
